Can energy bags be used for underwater compressed air storage?

3. This paper has described the design and testing of three prototype Energy Bags: cable-reinforced fabric vessels used for underwater compressed air energy storage. Firstly, two 1.8 m diameter Energy Bags were installed in a tank of fresh water and cycled 425 times.

How much energy does an airbag store?

The airbag was hung and filled with water, and its volume was measured to be approximately 0.465 m³. The maximum energy stored in the 1/4 downscaled airbag was approximately 9.3 kJ, determined by the product of the maximum volume and rated pressure. A 4 m prototype at a depth of 700 m can store an energy of 210 MJ, i.e., approximately 58.3 kW·h.

What is compressed air energy storage?

Compressed air energy storage (CAES) is an energy storage technology whereby air is compressed to high pressures using off-peak energy and stored until such time as energy is needed from the store, at which point the air is allowed to flow out of the store and into a turbine (or any other expanding device), which drives an electric generator.

How much energy is stored in a 1/4 downscaled airbag?

A suspension test for the model was performed to evaluate the displacement and storage volume. The airbag was hung and filled with water, and its volume was measured to be approximately 0.465 m³. The maximum energy stored in the 1/4 downscaled airbag was approximately 9.3 kJ, determined by the product of the maximum volume and rated pressure.

What is a flexible airbag?

A flexible airbag is an appropriate option for structural features. Compared with rigid designs [10,11,12], in which the air is delivered into the container and displaces seawater, a closed underwater airbag completely separates the air from seawater.
