Renewable energy systems require energy storage, and TES is used for heating and cooling applications [53]. Unlike photovoltaic units, solar systems predominantly harness the Sun's thermal energy and have distinct efficiencies. However, they rely on a radiation source for thermal support. TES systems primarily store sensible and latent heat.

Sensible heat storage is the most commonly used form of thermal energy storage, and the most (relatively) simple to implement. Sensible heat systems use energy to heat or cool solid or liquid matter such as water, salt, sand or rocks. In solar power systems, for example, the sun's energy is used to heat up water or salt in an insulated container.
