Discharge: In contrast, discharge occurs when the stored energy in the battery is released to power external devices or systems. During discharge, the chemical reactions within the battery cause electrons to flow from the negative electrode to the positive electrode through an external circuit, generating electrical current to power the load.

In electricity, the discharge rate is usually expressed in the following 2 ways. (1) Time rate: It is the discharge rate expressed in terms of discharge time, i.e. the time experienced by a certain current discharge to the specified termination voltage ch as C/5, C/10, C/20 (2) C rate: the ratio of the battery discharge current relative to the rated capacity, that is, times the rate.
