It uses excess energy from the local grid during the day, normally supplied by solar power, to compress and liquify the gas, storing it in steel tanks. The heat generated as a by-product during the process is stored in special Thermal Energy Storage units. When there's a need for electricity, the process is reversed.

2.6.9 Energy storage. Local energy storage can be applied to assist with voltage regulation (specifically voltage rise) in the presence of high levels of distributed generation. Energy storage may be used to absorb the active power injected by the local generation, reducing the amount exported into the supply network.
