If a lithium battery is left to self discharge to 0% SOC and remains in storage allowing the protection circuit to further deplete the cells, this often results in a damaged or unusable battery (unhappy customer). This site is excellent! Keep it up.

Tesla Lithium NMC battery cells. The Powerwall 2 uses lithium NMC (Nickel-Manganese-Cobalt) battery cells developed in collaboration with Panasonic, which are similar to the Lithium NCA cells used in the Tesla electric vehicles. The original Powerwall 1 used the smaller 18650 size cells, while the Powerwall 2, reviewed here, uses the larger 21-70 cells, ...

which is affected by DOD operating limits, DC round-trip efficiency, and capacity fade over the life of the battery. Each of these factors requires the initial BESS capacity rating to be scaled up to still provide the scenario's 605 kWh of useful storage at battery end of life (or just prior to replacement). Today's EV batteries have longer lifecycles. Typical auto manufacturer battery warranties last for eight years or 100,000 miles, but are highly dependent on the type of batteries used for energy storage. Energy storage systems require a high cycle life because they are continually under operation and are constantly charged and discharged ...

The Ragone plot is commonly used to compare the energy and power of lithium-ion battery chemistries. Important parameters including cost, lifetime, and temperature sensitivity are not considered. A standardized and balanced reporting and visualization of specifications would greatly help an informed cell selection process.

To understand the main differences between lithium-ion battery chemistries, there are two key terms to keep in mind: Energy density. A battery's energy density is closely related to its total capacity - it measures the amount of electricity in Watt-hours (Wh) contained in a battery relative to its weight in kilograms (kg). Power
