Is thermal energy storage a cost-effective choice?

Sensitivity analysis reveals the possible impact on economic performance under conditions of near-future technological progress. The application analysis reveals that battery energy storage is the most cost-effective choice for durations of ≤ 2 h, while thermal energy storage is competitive for durations of 2.3–8 h.

Are LIBs a promising technology for stationary electrochemical energy storage?

By calculating a single score out of CF and cost, a final recommendation is reached, combining the aspects of environmental impacts and costs. Most of the assessed LIBs show good performance in all considered application cases, and LIBs can therefore be considered a promising technology for stationary electrochemical energy storage.

What is the LCOE of thermal energy storage?

From 8 h to 16 h, the LCOE of thermal storage is under 0.5 CNY/kWh, making it economically competitive. The LCOS of lithium batteries and thermal energy storage overlap when the duration is between 2 and 4 h, and the economic advantage of thermal energy storage gradually exceeds that of lithium batteries.
