Do energy storage technologies provide flexibility in energy systems with renewable sources?

Storage technologies provide the power system with the flexibility required when intermittent renewables are present in the electricity generation mix. This paper focuses on the role of electricity storage in energy systems with high shares of renewable sources.

Why do energy systems need more storage facilities?

Future energy systems require more storage facilities to balance the higher share of intermittent renewables in the upcoming power generation mix ( Benato and Stoppato, 2018 ). This need is further emphasized as the demand for electric power is projected to reach 7200 GW by 2040 ( International Energy Agency, 2014 ).

What is energy storage?

Energy storage involves converting energy from forms that are difficult to store to more conveniently or economically storable forms. Some technologies provide short-term energy storage, while others can endure for much longer. Bulk energy storage is currently dominated by hydroelectric dams, both conventional as well as pumped.

Why is energy storage necessary?

Energy storage is necessary for successfully building an energy system model containing large shares of VRES (Variable Renewable Energy Sources). In their review of 75 energy systems models, Ringkjøb et al. (2018) highlight that the vast majority of them include at least one technological option for electricity storage.

How can storage technology help the power sector?

Storage technologies are a promising option to provide the power sector with the flexibility required when intermittent renewables are present in the electricity generation mix. The power sector needs to ensure a rapid transition towards a low-carbon energy system to avoid the dangerous consequences of greenhouse gas emissions.

How can energy be stored?

Energy can also be stored by making fuels such as hydrogen, which can be burned when energy is most needed. Pumped hydroelectricity, the most common form of large-scale energy storage, uses excess energy to pump water uphill, then releases the water later to turn a turbine and make electricity.
