Their compact size makes them well suited for use at distributed locations, and they can provide frequency control to reduce variations in local solar output and to mitigate output fluctuations at wind farms.

How can high entropy electrolytes be achieved?

Theoretically, high-entropy electrolytes can be achieved by introducing multiple salts or increasing the molecular diversity in electrolytes, both of which can decrease the solvation strength between Li^+ and solvents/anions [28,29], facilitating Li^+ conductivity and the formation of stable interphase passivation layers (Fig. 3 e).

Can cation and anion co-substituted high-entropy layered oxides improve energy density?

Very recently, Hu's group reported a cation and anion co-substituted high-entropy layered oxide in which simultaneous electronic and crystal structure modulation with Li/F substitution enabled the $\text{Na}_{0.95}\text{Li}_{0.07}\text{Cu}_{0.11}\text{Ni}_{0.11}\text{Fe}_{0.3}\text{Mn}_{0.41}\text{O}_{1.97}\text{F}_{0.03}$ cathode to exhibit enhanced overall energy density and structural stability.
