For instance, the revolution of energy cloud can result in around \$1 trillion worth of new global investment down the energy value chain for the next 30 years (or more). In addition, another \$1-1.5 trillion worth investment in digital infrastructure and associated services can be attained in the value chain by 2030.

The grid-based sharing energy storage technology, called cloud energy storage (CES) is proposed in, which provides users with energy storage services on-demand, anytime, anywhere. Users could subscribe to the energy storage service from the CES operator to meet their storage needs while saving the cost of investment in storage device [28].

In response to the randomness and uncertainty of the fire hazards in energy storage power stations, this study introduces the cloud model theory. Six factors, including battery type, service life, external stimuli, power station scale, monitoring methods, and firefighting equipment, are selected as the risk assessment set. The
