How do battery energy storage systems work? Simply put, utility-scale battery storage systems work by storing energy in rechargeable batteries and releasing it into the grid at a later time to deliver electricity or other grid services. Without energy storage, electricity must be produced and consumed at exactly the same time.

- Governmental incentives programs and national policies increase to push for decarbonization in energy sector - Global PCS revenue reached \$6.2 billion in 2022 and will grow up to \$40 in 2030 ... - Renewables in combination with energy storage systems are not the only way towards CO2 emission reduction.

Energy Storage Systems are structured in two main parts. The power conversion system (PCS) handles AC/DC and DC/AC conversion, with energy flowing into the batteries to charge them or being converted from the battery storage into AC power and fed into the grid. Suitable power device solutions depend on the

voltages supported and the power flowing.
