Do fire departments need better training to deal with energy storage system hazards?

Fire departments need data, research, and better training to deal with energy storage system (ESS) hazards. These are the key findings shared by UL's Fire Safety Research Institute (FSRI) and presented by Sean DeCrane, International Association of Fire Fighters Director of Health and Safety Operational Services at SEAC's May 2023 General Meeting.

What is battery energy storage fire prevention & mitigation?

In 2019, EPRI began the Battery Energy Storage Fire Prevention and Mitigation - Phase I research project, convened a group of experts, and conducted a series of energy storage site surveys and industry workshops to identify critical research and development (R&D) needs regarding battery safety.

What are battery storage fire safety initiatives?

These initiatives have included creating a battery storage fire safety roadmap, developing recommendations and leading practices for designing systems, and training and working with first responders responsible for putting out fires.

Where can I find information on energy storage failures?

For up-to-date public data on energy storage failures, see the EPRI BESS Failure Event Database.<sup>2</sup> The Energy Storage Integration Council (ESIC) Energy Storage Reference Fire Hazard Mitigation Analysis (ESIC Reference HMA),<sup>3</sup> illustrates the complexity of achieving safe storage systems.

Are energy storage systems flammable?

These systems combine high energy materials with highly flammable electrolytes. Consequently, one of the main threats for this type of energy storage facility is fire, which can have a significant impact on the viability of the installation.

How can EPRI help protect battery energy storage systems?

EPRI is currently working on a range of resources to help improve the safety of battery energy storage systems called the Project Lifecycle Safety Toolkit. It will include everything from data sets to white papers and guidebooks that provide practical steps to mitigate the risk of a battery fire and to optimize the response in case it occurs.

Battery Energy Storage Systems (BESS) can pose certain hazards, including the risk of off-gas release. Off-gassing occurs when gasses are released from the battery cells due to overheating or other malfunctions, which can result in the release of potentially hazardous amounts of gasses such as hydrogen, carbon monoxide, and methane.

Energy storage battery fires are decreasing as a percentage of deployments. Between 2017 and 2022, U.S. energy storage deployments increased by more than 18 times, from 645 MWh to 12,191 MWh, while worldwide safety events over the same period increased by a much smaller number, from two to 12.

The International Renewable Energy Agency predicts that with current national policies, targets and energy plans, global renewable energy shares are expected to reach 36% and 3400 GWh of stationary energy storage by 2050. However, IRENA Energy Transformation Scenario forecasts that these targets should be at 61% and 9000 GWh to achieve net zero ...

What is an ESS/BESS? Definitions: Energy Storage Systems (ESS) are defined by the ability of a system to store energy using thermal, electro-mechanical or electro-chemical solutions. Battery Energy Storage Systems (BESS), simply put, are batteries that are big enough to power your business. Examples include power from renewables, like solar and wind, which ...

Electrical energy (battery) storage forms a key part of renewable energy strategies. Given the benefits of electrical energy storage systems (EESSs) to consumers and electricity providers, and their ability to maximize the effectiveness of renewable energy technologies such as solar photovoltaic (PV) systems,

They are designed to provide stored, renewably generated energy at times of high demand. However, along with the benefits which a BESS application can provide, there is a need to fully assess the risk of fire and explosion when ...

We're helping developers, investors, local authorities and other public sector organisations across the built environment manage and mitigate the blast and fire risk posed by battery energy storage systems (BESS) by leveraging our involvement in fire research, our in-depth knowledge of codes and standards, and our expertise in fire service operations.

A nasty, long-burning fire near San Diego, Calif., last month provides graphic evidence of a risk inherent in large lithium-ion battery energy storage systems. As battery storage becomes more common with the rise of intermittent energy generation from solar and wind power, fire protection likely will become a prominent public concern. On May 15, a fire broke out at a ...
