Flywheel energy storage (FES) works by accelerating a rotor (flywheel) to a very high speed and maintaining the energy in the system as rotational energy. The energy is converted back by slowing down the flywheel. Most FES systems use electricity to accelerate and decelerate the flywheel, but devices that directly use mechanical energy are being developed.

Renewable energy sources are characterized by a fluctuating and intermittent nature, which simply means that energy may be available when it is not needed, and vice versa. Energy storage devices can ...

1 Introduction. Among all options for high energy store/restore purpose, flywheel energy storage system (FESS) has been considered again in recent years due to their impressive characteristics which are long cyclic endurance, high power density, low capital costs for short time energy storage (from seconds up to few minutes) and long lifespan [1, 2].

of high speed electric machines, FESS have been established as a solid option for energy storage applications [7-9,26,27]. A flywheel stores energy that is based on the rotating mass principle. It is a mechanical storage device which emulates the storage of electrical energy by converting it to mechanical energy.
