The amount of energy stored,  $E$ , is proportional to the mass of the flywheel and to the square of its angular velocity. It is calculated by means of the equation (1)  $E = \frac{1}{2} I \omega^2$  where  $I$  is the moment of inertia of the flywheel and  $\omega$  is the angular velocity. The maximum stored energy is ultimately limited by the tensile strength of the flywheel material.
