4 ENERGY STORAGE DEVICES. The onboard energy storage system (ESS) is highly subject to the fuel economy and all-electric range (AER) of EVs. The energy storage devices are continuously charging and discharging based on the power demands of a vehicle and also act as catalysts to provide an energy boost. 44. Classification of ESS:

The amount of useable energy is defined by its exergy, the component of energy that can be used to carry out work within a system. Additionally, most "waste" energy available within a system is in the form of heat (Fig. 2) which is typically of lower exergy than stored chemical or electrical energy for example. Whereas energy within a system remains constant, ...
