

Introduction to mobile energy storage solutions

What are the development directions for mobile energy storage technologies?

Development directions in mobile energy storage technologies are envisioned. Carbon neutrality calls for renewable energies, and the efficient use of renewable energies requires energy storage mediums that enable the storage of excess energy and reuse after spatiotemporal reallocation.

What is mobile energy storage?

In addition to microgrid support, mobile energy storage can be used to transport energy from an available energy resource to the outage area if the outage is not widespread. A MESS can move outside the affected area, charge, and then travel back to deliver energy to a microgrid.

What is a mobile battery energy storage system (MBESS)?

Based on BESSs, a mobile battery energy storage system (MBESS) integrates battery packs with an energy conversion system and a vehicle to provide peak-shaving resources [2] and reactive support [3] for disaster conditions, or to perform market arbitrage [4] in distribution networks.

How can mobile energy storage improve power grid resilience?

Improving power grid resilience can help mitigate the damages caused by these events. Mobile energy storage systems, classified as truck-mounted or towable battery storage systems, have recently been considered to enhance distribution grid resilience by providing localized support to critical loads during an outage.

How does mobile energy storage improve distribution system resilience?

Mobile energy storage increases distribution system resilience by mitigating outages that would likely follow a severe weather event or a natural disaster. This decreases the amount of customer demand that is not met during the outage and shortens the duration of the outage for supported customers.

What is a transportable energy storage system?

Referred to as transportable energy storage systems, MESSs are generally vehicle-mounted container battery systems equipped with standard-ized physical interfaces to allow for plug-and-play operation. Their transportation could be powered by a diesel engine or the energy from the batteries themselves.

As the world continues to enact progressive climate change targets, renewable energy solutions are needed to achieve these goals. One such solution is large-scale lithium-ion battery (LIB) energy storage systems which are at the forefront in ensuring that solar- and wind-generated power is delivered when the grids need it most. However, the perceived ...

1. Introduction. Battery energy storage systems (BESSs) have been deployed to meet the challenges from the variability and intermittency of the power generation from renewable energy sources (RESs) [1-4]. Without BESS, the utility grid (UG) operator would have to significantly curtail renewable energy generation to maintain system reliability and stability [5,6].
