Every element of the formula for energy in a magnetic field has a role to play. Starting with the magnetic field (B), its strength or magnitude influences the amount of energy that can be stored in it. A stronger magnetic field has a higher energy storage capacity. The factor of the magnetic permeability (μ) is intriguing.

From the viewpoint of crystallography, an FE compound must adopt one of the ten polar point groups, that is, C_1 , C_s , C_2 , C_{2v} , C_3 , C_{3v} , C_4 , C_{4v} , C_6 and C_{6v} , out of the total 32 point groups. [] Considering the symmetry of all point groups, the belonging relationship classifies the dielectric materials, that is, ferroelectrics ? pyroelectrics ? piezoelectrics ? ...

As the electric current produces a concentrated magnetic field around the coil, this field flux equates to a storage of energy representing the kinetic motion of the electrons through the coil. The more current in the coil, the stronger the magnetic field will be, and the more energy the inductor will store.

The energy density in an SMES is ultimately limited by mechanical considerations. Since the energy is being held in the form of magnetic fields, the magnetic pressures, which are given by (11.6) $P = \frac{B^2}{2\mu_0}$, rise very rapidly as B , the magnetic flux density, increases. Thus, the magnetic pressure in a solenoid coil can be viewed in a similar ...

But, if energy is charged or discharged, a time varying magnetic field causes dynamic loss especially the ac loss in the stabilizer, superconducting cable, all metallic parts, etc. In this study, we have considered the solenoid-type SMES coil since it has the advantage of high energy storage density and simplest configuration.

PHY2049: Chapter 30 49 Energy in Magnetic Field (2) •Apply to solenoid (constant B field) •Use formula for B field: •Calculate energy density: •This is generally true even if B is not constant

2. Energy storage stage: In this stage, the SC stores the magnetic energy and the SC current remains stable. Due to the zero resistance of the superconductor, the magnetic field does not decay. 3. Discharge stage: When the stored energy needs to be released, the SC is discharged and magnetic energy is released with declining SC current.
