Overview Types of accumulator Functioning of an accumulator See also External links A hydraulic accumulator is a pressure storage reservoir in which an incompressible hydraulic fluid is held under pressure that is applied by an external source of mechanical energy. The external source can be an engine, a spring, a raised weight, or a compressed gas. An accumulator enables a hydraulic system to cope with extremes of demand using a less powerful pump, to respond more quickly to a temporary demand, and to smooth out pulsations. It is a type of energy storage

In years gone by this was achieved using a deadweight. However, spring-type accumulators or hydro-pneumatic type accumulators are still used in modern hydraulic applications. Hydro-pneumatic accumulators, which use hydraulic fluid to compress nitrogen gas and hence the name hydro-pneumatic, are the predominant accumulator type.

Accumulator which stores a fluid under pressure and is therefore able to release hydraulic energy. Pressurisation is mainly based on gas pressure (air, nitrogen, "hydropneumatic accumulator") and, more rarely, springs or weights (spring accumulator, weighted accumulator). The latter is the only accumulator which keeps the pressure constant during withdrawal of the volume.
