What is coke used for?

Coke is used as a fuel for heatingin several industries, and the combustion of coke produces more CO 2 per fuel mass than coal 1. Coke is also used in the steel and aluminum industries as an anode for smelting, a process that also emits greenhouse gases 2.

How is coke made?

In the coking process, the heaviest components of petroleum are pressurized with steam and waterto form solid petroleum coke. This process takes place inside a large vessel called a "coker unit". The raw coke that comes directly out of a coker unit is termed "green coke" and has 10-20 wt% volatile hydrocarbons.

Can Needle coke be a more permanent feedstock for graphene production?

Not only can needle coke be a more permanent feedstock for graphene production, but this avenue also the petroleum portfolio away from high-emission end-uses. Graphite-derived graphene is well-documented 9,10,11, but coke-derived graphene has not been extensively explored.

However, these carbon materials are expensive and derived from scarce fossil fuels. Semi-coke (SC) is less expensive than most common materials [21]. SC is environmentally friendly and inexpensive, has been widely used for energy storage, catalysis, and adsorption, and is becoming an irreplaceable carbon material.
