What is pumped thermal energy storage (PTEs)?

Pumped Thermal Electricity Storage or Pumped Heat Energy Storage is the last in-developing storage technology suitable for large-scale ES applications. PTES is based on a high temperature heat pump cycle, which transforms the off-peak electricity into thermal energy and stores it inside two man-made thermally isolated vessels: one hot and one cold.

How does a pumped thermal energy storage system work?

In 2010, Desrues et al. were the first to present an investigation on a pumped thermal energy storage system for large scale electric applications based on Brayton cycle. The system works as a high temperature heat pump cycle during charging phase. It converts electricity into thermal energy and stores it inside two large man-made tanks.

What is pumped heat energy storage (PHES)?

Of the large-scale storage technologies (>100 MWh), Pumped Heat Energy Storage (PHES) is emerging now as a strong candidate. Electrical energy is stored across two storage reservoirs in the form of thermal energy by the use of a heat pump. The stored energy is converted back to electrical energy using a heat engine.
