

Principle of magnetic levitation energy storage

What are the applications of magnetic levitation?

In addition to transportation, magnetic levitation has other applications, such as energy storage. Maglev energy storage systems use superconducting magnets to store energy in the form of kinetic energy.

What is the principle of magnetic levitation?

The principle of magnetic levitation is based on the interaction between magnetic fields, which creates a force that levitates the object. There are two types of magnetic levitation: electrodynamic suspension (EDS) and electromagnetic suspension (EMS). EDS is commonly used in high-speed trains, while EMS is commonly used in levitating devices.

How does a magnet levitate an object?

The object is equipped with a magnet that generates a magnetic field, and the surface on which the object is levitating is equipped with a series of electromagnets that generate a magnetic field opposite in polarity to the object. The two magnetic fields attract each other, creating a force that levitates the object.

How can magnetic levitation improve the rotational speed and reduce maintenance loss?

To improve the rotational speed and reduce maintenance loss, magnetic levitation technology is utilized to actively regulate the displacements of the FW rotor in the FESS, considering the benefits of zero contact [23,24] and active controllability [25,26].

Does magnetic levitation have a piezoelectric principle?

Siddique et al. only refer to a study whose architecture comprises magnetic levitation, but the energy transduction mechanism includes the piezoelectric principle. Therefore, no review that presents major breakthroughs achieved on the scope of magnetic levitation architectures has been published so far.

What were the limitations of magnetic levitation?

In 1842, Samuel Earnshaw, an English clergyman and scientist, proved another important limitation of magnetic levitation. He showed that stable contact-free levitation by forces between static magnets alone was impossible; the levitated part would be unstable to displacements in at least one direction.
