LLC resonant converters are ideal for power supply applications with delicate systems (i.e. high-end consumer electronics), or power-demanding operations (i.e. charging electric vehicles). An LLC converter is made up of 4 blocks: the power switches, resonant tank, transformer, and diode rectifier (see Figure 1).

Considering the above requirements, there are several basic concepts that can be used for high-voltage pulse generation. The key idea is that energy is collected from some primary energy source of low voltage, stored temporarily in a relatively long time and then rapidly released from storage and converted in high-voltage pulses of the desirable pulsed power, as ...

There are two main designs for power supplies: a linear power supply and a switching power supply. o Linear: A linear power supply design uses a transformer to step down the input voltage. Then the voltage is rectified and turned into a direct current voltage, which is then filtered to improve the waveform quality.

Table 1: Isolated vs. Non-Isolated AC/DC Power Supplies. The main concern when choosing which step-down method to use is safety. The power supply is connected to the AC mains at the input, which means if there was a current leak to the output, an electric shock of this proportion could severely injure or cause death, and damage any device connected to the output.
