

Can energy storage devices be used in electrified railways?

This study presents the recent application of energy storage devices in electrified railways, especially batteries, flywheels, electric double layer capacitors and hybrid energy storage devices. The storage and reuse of regenerative braking energy is managed by energy storage devices depending on the purpose of each system.

Should rail vehicles have onboard energy storage systems?

However, the last decade saw an increasing interest in rail vehicles with onboard energy storage systems (OESSs) for improved energy efficiency and potential catenary-free operation. These vehicles can minimize costs by reducing maintenance and installation requirements of the electrified infrastructure.

Can energy storage devices be used in trains?

Many works on the application of the energy storage devices to trains were reported, however, they did not deal enough with the optimality of the control of the devices. The authors pointed out that the charging/discharging command and vehicle speed profile should be optimized together based on the optimality analysis.

Do we need a fair assessment of energy storage devices for electrified railways?

Therefore, it is opinion of the authors that the cooperation between manufacturers, customers and independent researchers is desirable for a fair assessment and a significant development of energy storage devices for electrified railways.

Can onboard energy storage systems be integrated in trains?

As a result, a high tendency for integrating onboard energy storage systems in trains is being observed worldwide. This article provides a detailed review of onboard railway systems with energy storage devices. In-service trains as well as relevant prototypes are presented, and their characteristics are analyzed.

How to select energy storage media suitable for electrified railway power supply system?

In a word, the principles for selecting energy storage media suitable for electrified railway power supply system are as follows: (1) high energy density and high-power density; (2) High number of cycles and long service life; (3) High safety; (4) Fast response and no memory effect; (5) Light weight and small size.

Transp., vol. 4, no. 1, pp. 9–26; EUR"20, 2013. [32] J. M. Miller, "Trends in Vehicle Energy Storage Systems: Batteries and Ultracapacitors to Unite," in Vehicle Power and Propulsion Conference, 2008. ... pp. 1–5. [47] M. Miyatake and K. Matsuda, "Energy Saving Speed and Charge/Discharge Control of a Railway Vehicle with ...

for decades. A comprehensive assessment of energy-saving technologies for rail systems was reviewed in [3,

4]. It is found that railway vehicle operation accounts for 70-90% of the total energy consumption in urban rail systems. Energy-efficient driving, ...

It can be minimised with the installation of reversible substations or energy accumulation equipment (at substations or onboard). ... Miyatake M, Matsuda K (2009) Energy saving speed and charge/discharge control of a railway vehicle with on-board energy storage by means of an optimization model. IEEJ Trans Electr Electron Eng 4:771-778.

Energy saving in the railway sector is a major consideration for current operators. This is driven by the continuing focus of environmental concerns, together with an increasing uncertainty about the availability and cost of liquid fuels. The extended cycle life of railway equipment means that decisions influencing traction systems can have lasting ...

The use of wayside energy storage devices, located in correspondence to the TPSs, could allow significant savings even in a high-speed system, where the braking frequency is quite low. The authors assessed to ...

This article provides a detailed review of onboard railway systems with energy storage devices. In-service trains as well as relevant prototypes are presented, and their characteristics are ...

Energy storage devices can improve the efficiency of electrified railways not only by energy saving, voltage regulation, power compensation and infrastructure power loss reduction, but also by allowing vehicles to run ...

electrified railway weighed against the mass and cost of the extra energy storage system added to the vehicle. For a vehicle with a mass of 65 tons, a battery system with a capacity of 600 Ah was found to be sufficient. Received: 17 August 2023 Revised: 14 February 2024 Accepted: 29 April 2024 Available online: 24 May 2024 Key words: rail ...

Abstract Concerns over future energy security, energy costs, and competitiveness with other modes have prompted the railway industry to search for cost-effective energy efficient traction solutions which will ensure continuing business feasibility. For non-electrified routes, where the business case for electrification is unfavourable, traction is usually ...

The on board energy storage system with Ultracaps for railway vehicles presented in this paper seems to be a reliable technical solution with an enormous energy saving potential.

Energy Saving Speed and Charge/Discharge Control of a Railway Vehicle with On-board Energy Storage by Means of an Optimization Model. Masafumi Miyatake, Corresponding Author. Masafumi Miyatake. Member Department of Engineering and Applied Sciences, Sophia University Kioicho 7-1, Chiyoda-ku, Tokyo 102-8554, Japan.

The use of high power and long-life energy storage systems with high inherent safety level ensures that the vehicle has the same performance in all operating modes in addition to higher safety. The traction batteries will be charged while the vehicle is operating in electrified sections and at selected locations of the route.

MANNHEIM Transport has started trials with on-board energy saving equipment developed by Bombardier. A light rail vehicle operated by MVV Verkehr AG has been fitted with the Mitrac Energy Saver, which captures regenerated braking energy and recycles it for use in subsequent acceleration. Put into revenue operation on September 5, ...

energy management in railway transit network with way-side (substation) supercapacitor (SC) energy storage system (ESS). Firstly, the structure of the wayside energy storage system is introduced. Secondly, the model of energy storage system is built and the control strategy is described. Thirdly, in order to estimate the required energy

Here we examine the potential to use the US rail system as a nationwide backup transmission grid over which containerized batteries, or rail-based mobile energy storage (RMES), are shared among ...

of energy efficient battery rail transportation. The model is developed as a case study for the Australian city of Hobart, Tasmania, and considers the life cycle cost of battery storage versus the installation of overhead line equipment for an existing rail alignment between Hobart CBD and the outer suburb of Bridgewater.

Rufer A (2010) Energy storage for railway systems, energy recovery and vehicle autonomy in Europe. In: Proceedings of the international power electronics conference (IPEC'10), Sapporo, Japan, 21-24 Jun 2010, pp 3124-3127. Steiner M, Klohr M, Pagiela S (2007) Energy storage system with ultracaps on board of railway vehicles.

Advanced Rail Energy Storage (ARES) uses proven rail technology to harness the power of gravity, providing a utility-scale storage solution at a cost that beats batteries. ARES" highly efficient electric motors drive mass cars uphill, converting electric power to mechanical potential energy. When needed, mass cars are deployed downhill ...

As an important part of urban public transport, urban rail transit has become an effective way to solve urban traffic congestion and air pollution because of its excellent characteristics, such as energy-saving, environmental protection, safety and fast, etc. Urban rail transit has become an effective way to solve traffic congestion and air pollution, and has been ...

This article provides a detailed review of onboard railway systems with energy storage devices. In-service trains as well as relevant prototypes are presented, and their characteristics are analyzed. A comprehensive study of the traction system structure of these vehicles is introduced providing an overview of all the converter

architectures ...

The optimal operation of rail vehicle minimizing total energy consumption is discussed in this paper. In recent years, the energy storage devices have enough energy ...

This paper describes how an on board energy storage system with Ultracaps for railway vehicles proved to be a reliable technical solution with an enormous energy saving potential. Bombardier Transportation already made a lot of experiences in this field, e.g. equipped one bogie of a prototype light rail vehicle (LRV) for the public ...

2 CURRENT STATUS OF THE RAIL SECTOR. Rail is already among the lowest-emitting and most efficient transport sectors. Despite a 9% share of total passenger and freight transport activity, railways account for less than 2% of direct and well-to-wheel greenhouse gas (GHG) emissions and about 3% of final overall energy use.

The optimal operation of rail vehicle minimizing total energy consumption is discussed in this paper. In recent years, the energy storage devices have enough energy and ...

Onboard energy storage in rail transport: Review of real applications and techno-economic assessments. Emanuele Fedele, ... From a system-level perspective, the integration of alternative energy sources on board rail vehicles has become a popular solution among rolling stock manufacturers. Surveys are made of many recent realizations of ...

vehicle equipment is difficult due to the installation of the large-capacity braking resistor on the have installed three energy storage systems for DC railway and one railway static power ...

Sifang Rolling Stock Co., Ltd. Has invented a rail vehicle hydrogen energy equipment installation device [9], which enables the ready assembly and disassembly of facilities and equipment through modular design, and at the same time can be adjusted in size according to hydrogen energy equipment or similar products to meet the needs of dif-

The optimisation of size and place were the significant factors which had to be appropriately considered. On the other hand, for an aboard energy storage device, the vehicle would require enough free space (normally on the roof) for accommodating the box of energy storage and the vehicle would have to carry approximately 2% more mass . The ...

Electrified railways are becoming a popular transport medium and these consume a large amount of electrical energy. Environmental concerns demand reduction in energy use and peak power demand of railway systems. Furthermore, high transmission losses in DC railway systems make local storage of energy an increasingly attractive option. An ...

The energy storage system (ESS) used in the DC feeding urban railway system is an equipment that recycles the regenerated energy produced by the railway vehicles as well stabilizing the catenary ...

power electronic equipment (inverters etc.) ... Assuming a 50 t light rail vehicle and a maximum speed of 80 km/h, the critical energy is 3,4 kWh. ... Stationary energy storage in Cologne light rail network . Since 2000 an energy storage system is tested in service in the Cologne local transportation network. The flywheel with an maximum energy ...

With the widespread utilization of energy-saving technologies such as regenerative braking techniques, and in support of the full electrification of railway systems in a wide range of application ...

However, due to the volatility and instability of renewable energy (e.g., wind and solar energy), railway systems need to be equipped with additional energy storage devices with large capacity [10] and long-term stability [11, 12] pared to the conventional ways of energy storage (battery, pumped hydro, compressed air etc.) [13], hydrogen has been widely used for ...
