

Can a solar heating system be used as a backup system?

The system can work as a backup solution, combined with existing conventional heating, or as a household's main heating system, with minimal use of grid electricity. Spanish heating specialist Elnur Gabarron has developed a new solar-powered residential heating concept based on the use of storage heaters.

How does active solar heating work?

Active solar heating systems use solar energy to heat a fluid-- either liquid or air -- and then transfer the solar heat directly to the interior space or to a storage system for later use. If the solar system cannot provide adequate space heating, an auxiliary or back-up system provides the additional heat.

Are solar heating & cooling systems a good investment?

Solar heating and cooling systems are particularly attractive as they are one of the most energy-efficient options out there. However, many homeowners might be deterred by the initial financial investment required to purchase and install these systems.

How do liquid systems store solar heat?

Liquid systems store solar heat in tanks of water or in the masonry mass of a radiant slab system. In tank type storage systems, heat from the working fluid transfers to a distribution fluid in a heat exchanger exterior to or within the tank. Tanks are pressurized or unpressurized, depending on overall system design.

A solar water heater is typically comprised of solar collectors which absorb solar energy, and a system to transfer the heat to the water. There are two main types of solar water heaters: passive systems, which rely on natural convection to move heated water, and active systems, which use pumps for circulation.

Solar thermal water heating is a temperamental thing. Water weighs a lot, it expands when it freezes, and it can cause scaling damage to pipes when it boils. Solar thermal systems are wonderfully efficient, and some systems work just fine for decades, but even these need regular inspection. When a solar thermal system fails, however, it sets about destroying ...

What is photovoltaic (PV) technology and how does it work? PV materials and devices convert sunlight into electrical energy. A single PV device is known as a cell. An individual PV cell is usually small, typically producing about 1 or 2 watts of power. These cells are made of different semiconductor materials and are often less than the thickness of four human hairs.
