Governments are trying to improve the penetration rate of renewable energy and accelerate the transformation of power market in order to achieve the goal of carbon peak and carbon neutral.

o Energy Density (Wh/L) - The nominal battery energy per unit volume, sometimes referred to as the volumetric energy density. Specific energy is a characteristic of the battery chemistry and packaging. Along with the energy consumption of the vehicle, it determines the battery size required to achieve a given electric range.

Unlike traditional power plants, renewable energy from solar panels or wind turbines needs storage solutions, such as BESSs to become reliable energy sources and provide power on demand [1]. The lithium-ion battery, which is used as a promising component of BESS [2] that are intended to store and release energy, has a high energy density and a long energy ...

Watt-hours measure how much energy (watts) a battery will deliver in an hour, and it's the standard of measurement for a battery. When dealing with large amounts of energy, like with batteries, capacity is typically measured in kilowatt hours (kWh) which is 1,000 watt-hours, or gigawatt-hours (GWh) which is one billion watt-hours.

For example, a 12 volt battery with a capacity of 500 Ah battery allows energy storage of approximately $100 \text{ Ah} \times 12 \text{ V} = 1,200 \text{ Wh}$ or 1.2 KWh. However, because of the large impact from charging rates or temperatures, for practical or accurate analysis, additional information about the variation of battery capacity is provided by battery ...

In Fig. 2 it is noted that pumped storage is the most dominant technology used accounting for about 90.3% of the storage capacity, followed by EES. By the end of 2020, the cumulative installed capacity of EES had reached 14.2 GW. The lithium-iron battery accounts for 92% of EES, followed by NaS battery at 3.6%, lead battery which accounts for about 3.5%, ...

For this blog, we focus entirely on lithium-ion (Li-ion) based batteries, the most widely deployed type of batteries used in stationary energy storage applications today. The International Energy Agency (IEA) reported that lithium-ion batteries accounted for more than 90% of the global investment in battery energy storage in 2020 and 2021.

Reducing energy consumption not only decreases greenhouse gas emissions but also fosters the efficient use of resources, contributing to a greener and more sustainable future [3]. The integration of renewable energy sources into our power systems is a key part of this endeavor, and the role of effective energy storage cannot be overstated [4], [5].

SOC (State-Of-Charge) is generally used to represent the residual capacity of energy storage battery. Its physical meaning is the ratio of the residual capacity of battery and its capacity in completely charging state. The energy storage battery module will take the charge-discharge power as input and SOC as output.
