Why is energy storage important?

Energy storage is a potential substitute for,or complement to,almost every aspect of a power system,including generation,transmission,and demand flexibility. Storage should be co-optimized with clean generation,transmission systems,and strategies to reward consumers for making their electricity use more flexible.

What will energy storage be like in 2024?

In 2024, the global energy storage is set to add more than 100 gigawatt-hoursof capacity for the first time. The uptick will be largely driven by the growth in China, which will once again be the largest energy storage market globally.

Should energy storage be regulated?

In markets that do provide regulatory support, such as the PJM and California markets in the United States, energy storage is more likely to be adopted than in those that do not. In most markets, policies and incentives fail to optimize energy-storage deployment.

Is it profitable to provide energy-storage solutions to commercial customers?
