Thermal energy refers to the energy contained in a system that is responsible for the temperature of the system. Thermal energy is the energy retained by an object or system as a result of particle movement inside the object or system.. Thermal energy can be described as an object's ability to perform work.; It is the energy contained within a system that causes it to heat up.

The storage of thermal energy is possible by changing the temperature of the storage medium by heating or cooling it. This allows the stored energy to be used at a later stage for various purposes (heating and cooling, waste heat recovery or power generation) in both buildings and industrial processes.
