Can a tram's driving strategy reduce energy consumption and extend battery life?

However, trams may face expensive battery replacement costs due to battery degradation. Therefore, this paper proposes a multi-objective optimization method for the tram's driving strategy to reduce operational energy consumption and extend battery life. The method describes the optimization problem as second-order cone programming (SOCP).

Why are lithium batteries used in energy storage trams?

Compared with the traditional overhead contact grid or third-rail power supply, energy storage trams equipped with lithium batteries have been developed rapidly because of their advantages of flexible railway laying and high regenerative braking energy utilization.

Can energy storage improve regenerative braking in a light rail system?

An energy storage system (ESS) is considered as an effective measure to improve regenerative braking and hence improve the energy balance of a light rail system, as it can store the un-utilized regenerated electricity and feed the stored electricity back to the supply network when needed (Morita et al., 2008, Teymourfar et al., 2012).
