Iron-based flow batteries designed for large-scale energy storage have been around since the 1980s, and some are now commercially available. What makes this battery different is that it stores energy in a unique liquid chemical formula that combines charged iron with a neutral-pH phosphate-based liquid electrolyte, or energy carrier.

And the penetration rate of the vanadium redox flow battery in energy storage only reached 0.9% in the same year. "The penetration rate of the vanadium battery may increase to 5% by 2025 and 10% by 2030, but the majority will still be lithium batteries," the battery raw-material analyst said.

Often called a V-flow battery or vanadium redox, these batteries use a special method where energy is stored in liquid electrolyte solutions, allowing for significant storage. Lithium-ion batteries, common in many devices, are compact and long-lasting.
