What is a distributed energy resource system?

Distributed energy resource (DER) systems are small-scale power generation or storage technologies (typically in the range of 1 kW to 10,000 kW) used to provide an alternative to or an enhancement of the traditional electric power system. DER systems typically are characterized by high initial capital costs per kilowatt.

What is the difference between centralized and distributed energy storage?

Distributed energy storage typically has a power range of kilowatts to megawatts; a short, continuous discharge time; and flexible installation locations compared to centralized energy storage, reducing the line losses and investment pressure of centralized energy storage power stations .

“The report focuses on a persistent problem facing renewable energy: how to store it. Storing fossil fuels like coal or oil until it's time to use them isn't a problem, but storage systems for solar and wind energy are still being developed that would let them be used long after the sun stops shining or the wind stops blowing,” says Asher Klein for NBC10 Boston on MITEI's “Future of ...

Storage devices can save energy in many forms (e.g., chemical, kinetic, or thermal) and convert them back to useful forms of energy like electricity. Although almost all current energy storage capacity is in the form of pumped hydro and the deployment of battery systems is accelerating rapidly, a number of storage technologies are currently in use.
